

HOUSANE FOR SALE

IUPAC NAME: Bicyclo[2.1.0]pentane
MOLECULAR FORMULA: C_5H_8
MOLAR MASS: 68.12 g/mol

USES

- Pharmaceutical research
- Strain-release synthesis
- Photochemical synthesis
- Process development

HOUSE FOR SALE—but this house is built under pressure. Housanes are tiny, highly strained molecules that store an unusual amount of chemical energy in their distorted ring structure. This strain can release its stored tension to drive further chemical transformations. The breakthrough came when researchers at the University of Münster found a way to build these difficult structures from simple starting materials using blue light and a photocatalyst, making this unusual reservoir of molecular energy far easier to access.
